Issue 6.

GQRP Component Data Book

How it all works.

This is a group project and is designed to grow over the years. It should definitely not be seen as the work of a few or even an individual but contributed to by any club member who can type or draw. It doesn't even need to be a thing of beauty as you can submit a hand sketch if you wish or something that you have used software to design. The only stipulation is that it is your own work or you have permission from the copyright holder to submit it to the compiler, Tony G4WIF. The submission must contain your name (and callsign if you have one), and if it is the work of someone else, then acknowledgement that it is being reproduced with their kind permission.

How to Submit.

Two file formats are proposed because the club does not have all the software that you might have. You can send a Microsoft Word File or convert your work to Portable Document format. All PC's are capable of this - and if you need advice then contact Tony G4WIF.

The club website will host an example Word template if you would like to use it but it isn't mandatory, just as long as the work carries credit to the author.

Finally ...

This document may not be sold and the club would very much appreciate that it is not hosted on any other website.

The Handiman's Guide to

CAPACITORS

Paul Harden, NA5N (NA5N@Rt66.com)

Capacitors comprise the *largest variety* of electronic components. There are many types of capacitors, great variations in their performance, many methods of packaging and marking, and dozens of major manufacturers, not to mention new types constantly being introduced with specific applications and performances. As a result, capacitors often cause lots of problems for homebrewers. Hopefully this article will take some of the mystery out of the myriad of capacitors available, plus present some of the classic "do's and don'ts."

PRINCIPAL CAPACITOR TYPES

There are many capacitor types, which usually refers to the material used for the electrodes, dielectric, and the packaging or sealing method. Here are some of the major capacitor types used by QRPers:

DISK CERAMIC CAPACITORS

Disk Ceramics consist of two metalic plates separated by a ceramic dielectric, whose area and spacing determines the capacitance. These caps are low cost and suitable for many applications. Their main disadvantage is high capacitance changes

Solid Electrodes
Ceramic Dielectric
Epoxy Encapsulation

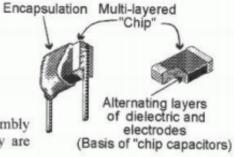

with temperature (high temperature coefficient), except for the "NPO" varieties that are temperature stable. These caps are the most commonly used for general purpose circuits, but the *non-NPO types* should be avoided in frequency determining circuits.

MONOLITHIC CERAMIC CAPACITORS

Alternating layers of electrodes and ceramic dielectric allow higher capacitances in physically smaller packages. Their characteristics are very similar to disk ceramics. They are encapsulated in epoxy to withstand insertion, soldering and

solvent cleaning by the automatic PCB assembly machines. Introduced for mass production, they are inexpensive and available from surplus dealers.

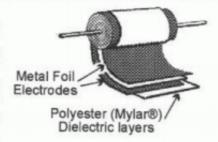

POLYESTER FILM CAPACITORS

Polyester Films use layers of metal and polyester (Mylar®) dielectric to make a wide range of capacitances in relatively small packages at low voltages. These have become the standard caps for DC applications. The "rolled" film layers

cause high dissipation and capacitance vs. temperature problems, and should be used carefully in high frequency or high current applications.

Title: Handyman's Guide to Capacitors

Author: Paul Harden NA5N

Page 1 of 6

POLYPROPELENE FILM CAPACITORS

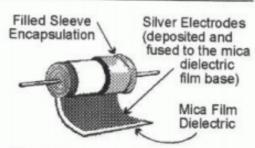

Polypropelene Films use layers of metal and polypropelene dielectric films virtually identical to Polyester Film caps. The polypropelene, however, is a dielectric offering a higher breakdown voltage than polyester, and thus more suitable for high voltage applications, such as switching power supplies. They also have low loss factors and good

capacitance stability making them a good choice for high frequency applications, including oscillators and other frequency sensitive circuits. The main disadvantages are a slightly higher cost, and larger physical sizes over other film dielectric capacitors.

SILVER MICA CAPACITORS

This is a type of capacitor known as metalized film capacitor, in that the electrodes are a metal deposited by a sputtering process onto the dielectric film. Silver Mica's use a mica film dielectric with a thin layer of deposited silver forming the electrodes. These are very stable capacitors for high frequency circuits and the

preferred choice for VFO and oscillator circuits. The main disadvantage are their higher cost, low operating voltages, and sometimes hard to find from hobby vendors.

POLYCARBONATE FILM CAPACITORS

These capacitors have become the standard for high stability MIL-SPEC film dielectrics. Their very low dissipation and extreme temperature stability make them almost the ideal capacitor --at a price! They are very expensive capacitors and not available from the hobby vendors, but listed here in the event you have the opportunity to appropriate some!

ELECTROLYTIC CAPACITORS

Aluminum Electrolytics are the most common, inexpensive electrolytic available from all hobby vendors. They are made similar to the polyester films, using aluminum foil electrodes and a dielectric material rolled into layers to increase the effective plate area to form high capacitances in small packages. The aluminum foil is "wetted" with a chemical agent to assist in conduction and increases the dielectric properties when a DC voltage is applied. This wetting agent can dry out after long periods of no use, or

exceeding the rated voltage, causing a breakdown of the dielectric and component failure (usually a short circuit between the terminals). This is why electrolytics are often found shorted in older equipment that has not been powered for years. This is seldom a problem with equipment that is periodically powered up. These inexpensive aluminum electrolytic caps are suitable in all QRP applications.

TANTALUM CAPACITORS

Tantalum's are a most unusual process that yeilds a high reliable electrolytic with a long life. Tantalum pentoxide powder is mixed with a manganese dioxide electrolyte and formed into a "pellet," forming both the dielectric and the positive electrode plate. Graphite or silver plating forms the negative plate. This "pellet" forms a very large effective plate area, and thus very high capacitances in very small packages. Both wet and dry electrolytes are used, and called wet or dry tantalums. There are few QRP applications where

tantalum's would be a must, but if you have them -- use them! The chief disadvantages are higher cost due to the complicated manufacturing process, and ensuring you never reverse the polarity. A small positive voltage on the negative terminal can fuse the "pellet."

Author: Paul Harden NA5N

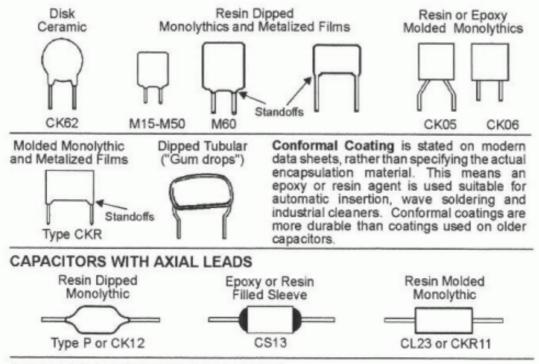

Page 2 of 6

PRINCIPAL PACKAGING STYLES

In addition to the capacitor types (ceramic, metalized films, etc.), the packaging *style* is also important, and often required when ordering. The major capacitor packaging styles are shown below, which can also be used as an aid in identifying unknown capacitors.

CAPACITORS WITH RADIAL LEADS

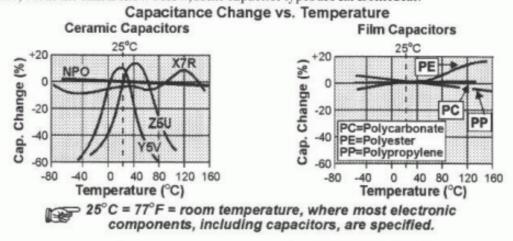

ORDERING/SPECIFYING CAPACITORS

When ordering capacitors, obviously the first concern is the capacitance, voltage rating and capacitor type needed. However, the *temperature coefficient* (TC) should be considered in frequency sensitive circuits (oscillators, VFO's, etc.) and the *dissipation factor* (DF) or Q when efficient energy transfer is needed (interstage coupling, active filters, etc.) or high peak-to-peak voltages (transmitter output filter caps).

TEMPERATURE COEFFICIENT

The temperature coefficient (TC) is the change in capacitance vs. a change in temperature. The ideal capacitor should have very little capacitance change with temperature, but as the charts show below, some capacitor types are far from ideal!

Title: Handyman's Guide to Capacitors

Author: Paul Harden NA5N

Page 3 of 6

The most common ceramic/monolithic ceramics are X7R, Z5U and Y5V. The Z5U and Y5V have a large temperature coefficient (and a large dissipation factor -- see below) and should not be used in frequency critical circuits or for coupling between stages. They are suitable for other general purpose applications and for DC and bypassing caps.

X7R's are the next best with moderate capacitance change vs. temperature and suitable as a general purpose capacitor, and can be used in oscillator circuits where moderate drift is acceptable.

NP0 (or C0G) are those ceramicsmade with a temperature stable dielectric which exhibits very little capacitance change with temperature. NP0's (N-P-zero) are recommended for oscillators and frequency sensitive circuits.

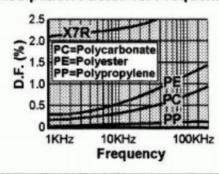

FILM CAPACITORS, such as the polyester and polypropylene, have much better capacitance stability vs. temperature than the general purpose ceramics, as also shown in the charts. Polyester caps are quite stable until about 120F.

DISSIPATION FACTOR (DF)

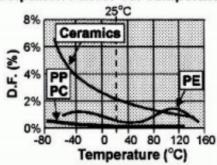

The **Dissipation Factor (DF)** is the ratio of the energy dissipated (lost) to the energy stored in the capacitor. The DF is frequency sensitive and specified at a certain frequency, such as 1KHz (for ceramics). The **Quality Factor (Q)** is the ratio of the energy stored vs. the energy dissipated - or the opposite of the dissipation factor. Film capacitors are usually specified by their "Q" factor.

Capacitors used for coupling small signals between stages, in active filters, the shunt caps on crystal filter, or in the transmitter output filter, should use low DF caps. Most all polyfilm caps and some monolithic ceramics meet this requirement. Old ceramic caps in your transmitter output filter should be replaced with a low DF capacitor type, as a high DF cap here can absorb a surprising amount of your output power, and us QRPers need to get as much of that power to the antenna we can!

Dissipation Factor vs. Frequency

Dissipation Factor vs. Temperature

THE BOTTOM LINE

Ceramics that are not NP0 make good general purpose capacitors for bypass caps, etc. but should not be used for interstage coupling or in oscillators. When ordering new caps, I would recommend purchasing the monolithic ceramics for their lower cost.

NP0 Ceramics (especially the mono's) are a good choice for oscillator circuits.

Film Dielectrics are a good choice for a general purpose capacitor with low dissipation factors and good temperature characteristics. With their reasonably low cost, and about the same as ceramics, they would be today's preferred choice when purchasing new capacitors due to the low cost and better performance characteristics.

When ordering caps, look at the specifications carefully for TC and DF, along with the information and charts in this article, to make the best choice, performance vs. cost.

Author: Paul Harden NA5N

Page 4 of 6

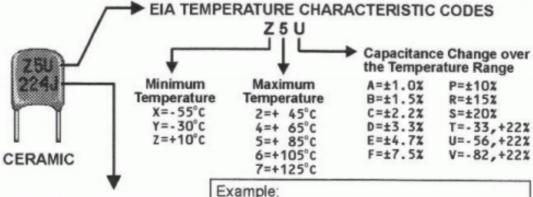

REFERENCE INFORMATION

The information on the following two pages is meant to be a general reference guide to assist in identifying capacitors, specifications and standard values.

VALUE AND TOLERANCE

Z5U = Capacitance change is -56% to +22% over the temperature range +10°C to +85°C

Capacitive Number of Zeroes

Example: **224J** = 220000pF = .22uF, 5% Tol.

* <10pF, tolerance in pF (codes C-G)</p>
* >10pF, tolerance in % (codes F-Z)

2. DIRECT VALUE MARKING

uf uf Some manufacturer's mark the capacitance value directly on the case, along with other information. Ceramics will use the EIA codes (Z5U, X7R, etc.) while non-ceramics will

use the industry codes (NPO, N150, etc.) for the temperature coefficient.

EIA DECADE VALUES:

Ex.: 203=.02uF, 473=.47uF, 503=.05uF, 5R1=5pF, 220=22pF, 221=220pF, etc.

3. INDUSTRY MARKINGS FOR MONOLYTHIC & FILM CAPACITORS

Non-ceramic capacitors use the EIA markings for the capacitance value and tolerance. However, these dielectrics, such as polyester or polypropelene, have a linear change in capacitance per °C

and thus the temperature coefficients are expressed in parts-per-million (ppm)/°C or in %/°C. A few of the common industry (non-ceramic) and EIA (ceramic) markings are shown in the following table.

I		nics (EIA) & Films Dielectrics				
I	EIA#	INDUSTRY	T.C. (ppm/°C)			
I	COG	NPO		Oppm/°C		
ı	S1G	NO33		ЗЗррм		
ı	U1G	N075	-	75ppm		
I	P2G	N150	-	150ppm		
ı	S2H	N330	-	330ppm		
I	U2J	N750	-	750ppm

4. COLOR CODING SCHEMES

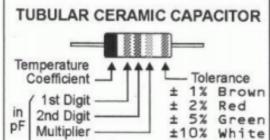

Capacitor color coding schemes have all but disappeared except on some foreign made ceramics and dipped tantalums. The prevalent schemes are shown below.

Color	1st-2nd Digit	Multi- plier		Tol.	pp	T.C. m/°C
Black	0	1	±2	202		0
Brown	1	10	±	1%	-	30
Red	2	100	±	2%		80
Orange	3	1K			-	150
Yellow	4	10K			- 7	220
Green	5	100K	±	5%	- 3	330
Blue	6	1 M			- 4	470
Violet	7					750
Gray	8	.01			+	30
White	9	.1	±1	10%	+	500
TABLE	Capac Values capa typ	for all citor	Temp. Coefficient and Tolerance for Ceramic/Monolythic types only			

Use Table 1

STANDARD CAPACITOR VALUES

±20% Black

These are the EIA standard capacitor values. These are the values available from most vendors. Non-polarized run from 1pF to 1uf, while electrolytics are available from 0.1uF and higher (not all electrolytic values listed here).

	1.0pF	10pF	100pF	.001uF	.01uF	.1uF	1.0uF	10uF	
	1.2pF	12pF	120pF	.0012uF	.012uF	.12uF	1.2uF	12uF

Notes:

This list includes all valves featured in Sprat editions 1 - 177.

'All numeric' valve identifiers appear first followed by alpha-numeric identifiers, each sorted in ascending order.

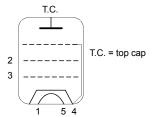

Mazda Octal and International Octal valve bases are not mutually compatible due to minor differences in pin spacings.

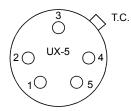

All bases are shown as an underside view i.e. viewed from the pin end of the valve unless otherwise stated. A few valves are shown with an additional side view where it is appropriate.

A = anode, C = cathode, , G or G1 = control grid, G2 = screen grid, G3 = suppressor grid, H- = negative heater, H+ = positive heater, I.C. = internally connected, N.C. = not connected T.C. = top cap.

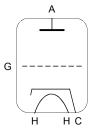

Internally connected pins should be left disconnected except for the VR series of gas regulator where they may be used to disconnect the circuit if the regulator is removed.

The GQRP Club

If you have found this book useful....

.. please consider joining the GQRP club (if you are not already a member). The subscription rates are published on the club website at www.gqrp.com and are lower than you might expect. This is because the club is run entirely by volunteers so your subscription goes a long way.

We have a quarterly magazine called "Sprat" and a club sales manager who can provide components to members at a much reduced price. Plus we have other items for sales such as DVD's and books.

We offer a club QSL bureau, technical advice and awards to work towards for achievement in QRP.

Our membership secretary can be contacted with any enquiries regarding joining the club and we also have representatives in many countries if you prefer dealing with someone local.

Contact details for everyone involved in running the club can be found on the club website (www.gqrp.com).

Finally ...

Thank you to all the contributors of this component data book.
